Software Engineer Assessment

We have a basic Software Engineer Challenge Project.

Our Software Engineer Challenge Project is a TO-DO app. It is like Wunderlist and Todoist. We expect you to develop the backend for a simple to-do app with accompanying unit tests.

In the application, users should be able to register and create their own to-do lists.

You need to push your project into Github and share the link with us. You have two options for project deployment.
1. Heroku
2. You can create Dockerized project and push your project into Docker Hub.

Your project should include a Readme file with simple instructions to:
1. Build your app
2. Run the test suite
3. Run your app with dependencies

Technology Stack:
• Java 8/11/17/21
• Spring Boot
• Spring Data Couchbase
• Couchbase
• Swagger
• Maven
• Docker
• JUnit and Mockito
• (Optional) Vue.js / React / Angular frontend
